

To use the basic texture mapper, you input a black and white image where white is 1 color that you want mapped, and black is the other color. This works great for 2 color models like the candycane, the presents, and the sign. These all utilize this shader, and thus, they are all customizable to be whatever colours, metallic, and smoothness you want.

The inputs are as follows:

Color1 (Color): the primary color

Color2 (Color): the secondary color

Metallic1 (Float): A slider to determine how metallic the primary surface is

Metallic2 (Float): A slider to determine how metallic the secondary surface is

Smoothness1 (Float): A slider to determine how smooth the primary surface is

Smoothness2 (Float): A slider to determine how smooth the secondary surface is
